Question Label: Multiple Select Question

The following pseudocode is executed using the "Olympics" dataset. The template of "Olympics" dataset is attached in the beginning of this paper. At the end of the execution, **medalDict** stores a dictionary with player's name as key mapped to another dictionary. The nested dictionary stores the medal type as key mapped to a list of years in which the player won that medal. For example if player Xyz has won a silver medal in 2006, a gold medal in 2008, and another silver medal in 2011, then

```
medalDict = {"Xyz" : {"Silver" : [2006, 2011], "Gold" : [2008]}, ... }
```

Assume that every player has a distinct name. But the pseudocode may have mistakes. Identify all such mistakes (if any). Assume that all statements not listed in the options below are free of errors. It is a Multiple Select Question (MSQ).

```
medalDict = {}
1
    while(Table 1 has more rows){
2
3
        Read the first row X in Table 1
        if(isKey(medalDict, X.Name)){
4
5
            if(not(iskey(medalDict[X.Name], X.Medal))){
                medalDict[X.Name][X.Medal] = medalDict[X.Name][X.Medal] ++
6
    [X.Year]
7
            }
8
            else{
9
                medalDict[X.Name][X.Medal] = [X.Year]
10
            }
11
12
        else{
13
            medalDict[X.Name][X.Medal] = [X.Year]
14
        Move X to Table 2
15
    }
16
```

#### **Options:**

6406531958508. Line 1: Incorrect initialization of medalDict

Line 6: The current statement should be replaced by

```
1 | medalDict[X.Name][X.Medal] = [X.Year]
```

# Line 9: The current statement should be replaced by

```
1 | medalDict[X.Name][X.Medal] = medalDict[X.Name][X.Medal] ++ [X.Year] 6406531958510.
```

Line 13: The current statement should be replaced by

```
1 | medalDict[X.Name] = {X.Medal : [X.Year]}
```

Question Label: Multiple Select Question

Let **LA** be a sorted list of integers in ascending order, and **X** be an integer. The procedure **insert(LA, X)** returns a list **LB** where **X** is added to **LA** such that the **LB** remains sorted. But the procedure may have mistakes. Identify all such mistakes (if any). Assume that all statements not listed in the options below are free of errors.

It is a Multiple Select Question (MSQ).

```
Procedure insert(LA, X)
2
        LB = \{\}
3
        flag = True
        foreach A in LA{
4
5
            if(flag){
6
                if(X \le A)
 7
                     LB = LB ++ [A]
                     flag = False
8
 9
                 }
            }
10
            LB = LB ++ [A]
11
12
13
        if(not flag){
            LB = LB ++ [X]
14
15
16
        return(LB)
17
    End insert
```

## **Options:**

6406531958531. ✓ Line 2: **LB** should be initiated as an empty list

6406531958532. \* Line 5: Conditional expression should use "not" operator

6406531958533. ✓ Line 7: **X** should be appended to the list **LB** 

6406531958534. \* Line 11: **X** should be appended to the list **LB** 

6406531958535. ✓ Line 13: Incorrect Conditional expression

6406531958536. \* Line 16: **LA** should be returned

Question Label: Multiple Select Question

Alice and Bob are two friends. They decide to play a game of toss, in which each of them holds a coin. They toss their coins alternately for a fixed number of times, and the results of the series of tosses are recorded in **alist** (which is a list of lists). Each entry in the inner list results the outcome of one pair of coin tosses of the form [i, j] where i stores the outcome for Alice and j stores the outcome for Bob.

For example, **alist** = [['H', T'], [T', T'], [T', 'H']] implies that at the first trial Alice has a outcome 'H' and Bob has an outcome 'T', at the second trial Alice has a outcome 'T' and Bob has a outcome 'T', and at third trial Alice has a outcome 'T' and Bob has a outcome 'H'.

To determine the winner, a procedure **findWinner(x)** is called that accepts **aList** as a parameter and returns **c**. If **c** = 0, then Bob is the winner; if **c** = 1, then Alice is the winner; and **c** = 2 if it is a draw. Which of the following procedure(s) correctly identify/identifies the winner? It is a Multiple Select Question (MSQ).

#### **Options:**

6406531958527.

Consider a dictionary **dict** = { 'A' : [1, 2, 3, 4, 5], 'B' : [6, 7, 8, 9], 'C' : 19 }. The following procedure **DoSomething(X)** is executed on the dictionary **dict**. What does the procedure **DoSomething(X)** return?

It is a Multiple Select Question.

```
procedure DoSomething(dict)
foreach i in keys(dict){
   return(dict[i])
}
end DoSomething
```

## **Options:**

6406531958541. ✓ The procedure may return [6,7,8,9]

6406531958542. \* The procedure always returns [1,2,3,4,5] since the key A comes first alphabetically

6406531958543. \* The procedure may return [1,2,3,5]

6406531958544. **✓** The procedure may return 19

Question Label: Multiple Select Question

The following pseudocode is executed using the "Library" dataset. The template of "Library" dataset is attached in the beginning of this paper. **p** is a list of authors who have written books in English. **dict[X]** stores the number of books having at least 100 pages and written on or before 2000 by author **X**. Choose the correct code fragment(s) to complete the pseudocode.

It is a Multiple Select Question (MSQ).

```
1 dict = { }
2
   foreach author in p{
3
       dict[author] = 0
4
   }
5
   while(Table 1 has more rows){
6
       Read the first row X from Table 1
7
8
                Fill the Code
        *********
9
10
       Move X to Table 2
11
```

## **Options:**

```
1 if(isKey(dict, X.Author) and (X.Pages >= 100 and X.Year <= 2000)){
2    dict[author] = dict[author] + 1
3 }</pre>
```

6406531958545. **V** 

```
if(isKey(dict, X.Author) or (X.Pages >= 100 and X.Year <= 2000)){
    dict[author] = dict[author] + 1
}</pre>
```

6406531958546. \*\*

```
C = False, D = False
 1
    if(isKey(dict, X.Author) and (X.Pages >= 100)){
 2
        C = True
 3
 4
    if(isKey(dict, X.Author) and (X.Year <= 2000)){
 5
        D = True
 6
 7
    if(C and D){
        dict[author] = dict[author] + 1
 9
10
    }
```

6406531958547.

```
C = False, D = False
    if(isKey(dict, X.Author) and (X.Pages >= 100)){
 2
 3
        C = True
 4
 5
   if(isKey(dict, X.Author) and (X.Year <= 2000)){
 6
        D = True
 7
   }
   if(C or D){
8
